Client: Winvic
Value: £undisclosed
Location: Heathrow

Provectus undertook a program of LNAPL recovery, removal of impacted soils and polishing of residual impact using ORC.

The initial phase of works was to excavate the impacted soils and dispose of the soils off site. Then to remove contaminated water and recover LNAPL. During the remediation works it was decided that on site treatment of the soils was practical. Subsequently, excavation and bioremediation treatment of over 2,000m³ of hydrocarbon impacted soils took place on site. In addition, the excavation and export of asbestos impacted soil for off site disposal was completed.

In order for the client to achieve their ambitious programme, Provectus worked around the Enabling Works Contractor to help them meet their timescale. This required a rapid response to ensure work started on site swiftly and was completed on time.

The work was completed on a fixed cost basis, and on time.
